

ernie

A daily visit that notices a bad day at home before it becomes a hospital day.

Christopher Pluntke · September 2026

Margaret is 84.

Every morning she signs Ernie's book. This morning she was slower, and nobody was there to notice.

Hypoactive delirium, the most common kind, looks like nothing at all: quieter, slower, a little withdrawn. The cause is usually cheap to fix on the day: an infection, dehydration, a new tablet. Missed, it ends in the emergency room.

60–75%

of cases unrecognised in hospital and in the ED ¹

7 M+

hospitalised US adults affected each year ²

40–100 k

lives a year, if home detection prevented delirium as well as hospital programmes do. A ceiling ⁸

Delirium is a change from your own baseline. The home never had one.

¹ Narrative review (PMC 2026); ED delirium screening (PMC 2024). ² Frontiers in Public Health 2026, MCBS 2019–21. ⁸ Witlox et al., JAMA 2010 (38.0% vs 27.5% dead at ~2 years, adjusted HR 1.95) × 1.3–2.6 M older adults a year × 30–40% preventable (HELP). Association, not proof; see sources slide.

Step 1 of 4: Signing in

Thank you, Margaret.

✓ **Done**

Lovely to see you. Here is your page in the book.

Thursday 17 September

Carry on

The gap is the 30 days at home.

Hospitals and ACOs now carry the cost of the 30 days after discharge (TEAM, LEAD), and since July CMS's ACCESS model pays fixed amounts for tech-enabled chronic care ⁹.

Medicare 30-day readmissions by cause at first admission, 2020 ³

Delirium is not a diagnosis category here. It rides inside these stays and multiplies the odds of coming back by 2.6 ⁵. About 11% of Medicare hospital stays involve it ².

³ AHRQ HCUP Statistical Brief 307, NRD 2020. ⁴ CMS HRRP; KFF, 10 Years of Hospital Readmissions Penalties (FY2022). ⁵ Community hospital cohort, n = 8,645, OR 2.60 (PMC 2019). ⁶ van Walraven et al., CMAJ 2011. ⁷ Back-of-envelope from ^{2,3,5}; upper bound; see sources slide. ⁹ CMS Innovation Center: TEAM (2026), LEAD (2027), ACCESS (July 2026).

\$36 B

a year: 2.0 M Medicare readmissions at \$18,100 each, 17 per 100 stays ³

up to 3%

off every Medicare inpatient payment for a year when a hospital's readmissions run high. FY2022: 2,499 hospitals, \$521 M ⁴

+\$8,110

in hospital charges when a stay involves delirium, against a stay that does not ²

\$3.6–5.4 B

a year of Medicare readmissions attributable to delirium. If a quarter is avoidable, as for readmissions generally: about \$1 B ^{6 7}

No tests. Just a visit.

She makes something every day: a signature, her own words, a finished picture. Each one is also a measurement.

Goodbye

did she come · how fast

What the phone saw.

“Margaret’s signature was slower, more hesitant and a different shape than usual today.”

Her usual, and today. It looks the same. It wasn't.

What the family sees. Margaret sees a thank-you and her page in the book.

FEATURE	TODAY	USUAL	ROBUST Z
Time to first stroke	418 ms	420 ms	-0.1
Total time	4.46 s	3.06 s	+5.7 unusual
In-air time	1.07 s	267 ms	+37.8 unusual
Strokes	3	3	+0.0
Mean speed	0.650	0.778	-2.1 unusual

Nine features against her own five-day baseline: time to start, total time, pauses, strokes, speed, smoothness, size, shape.

Robust z: today minus her usual, over her usual spread. Well outside on two features is a flag. Three days is a trend.

Real numbers from the demo build.

How it was built.

A pipeline with a reviewer in it.

What's next

1

Data leaves the phone

One process, one file: events, baselines, a family link.

2

Three real people, three days

Does a finger signature hold a baseline? Does a live doodle beat a check-in?

3

The explanation layer

A flag opens what changed, what it usually means, who to call before the ER.

Decision support, never a diagnosis. A human on every flag.

Who pays

CMS's ACCESS model (July 2026) pays fixed, outcome-aligned amounts for tech-enabled chronic care instead of fee-for-service. TEAM and LEAD make hospitals and ACOs carry the 30 days at home.

A daily visit is what those models pay for ⁹

Synthetic people only. Not a medical device.

Sources

- 1 Delirium unrecognised in up to 60% of hospital cases and about 75% in the emergency department.
 - 2 Delirium affects over 7 million hospitalised US adults a year; 11% of Medicare beneficiaries had an episode; +\$8,110 hospital charges per delirium stay (95% CI \$1,860–\$14,360).
 - 3 Medicare: 2,002,700 30-day readmissions in 2020, 17.0 per 100 index stays, \$36.2 B aggregate, \$18,100 average. Top causes at index admission: septicemia 207,300; heart failure 147,800; acute renal failure 60,000; pneumonia 58,900; diabetes with complications 58,700.
 - 4 HRRP reduces a hospital's Medicare inpatient payments by up to 3% for a fiscal year when 30-day readmissions for six conditions exceed the expected rate. FY2022: 2,499 of 3,139 hospitals penalised, average 0.64%, 39 at the 3% maximum, about \$521 M withheld.
 - 5 Inpatient delirium associated with 30-day readmission, adjusted OR 2.60 (95% CI 1.96–3.44); 718 delirious vs 7,927 non-delirious patients, one community hospital, 2010–2015.
 - 6 Median 27% of readmissions judged avoidable across 34 studies (range 5–79%). Multicomponent prevention (HELP) cut delirium incidence from 15.0% to 9.9%.
 - 7 Back of the envelope: 11.8 M Medicare stays $\times$ 11% = 1.3 M delirium stays. With 2.0–2.6 $\times$ the readmission risk and a 17% overall rate, delirium stays run 15–23 points above the rest: 200–300 k excess readmissions $\times$ \$18,100 = \$3.6–5.4 B a year. $\times$ 27% avoidable $\approx$ \$1.0–1.5 B. Upper bound: delirium also marks sicker patients, and no trial yet shows a home check-in reduces readmissions.
 - 8 Lives: 38.0% of older patients who had delirium were dead at $\sim$ 2 years vs 27.5% of controls (adjusted HR 1.95, 95% CI 1.51–2.52; 7 studies). That 10-point excess on 1.3–2.6 M older adults a year is 130–270 k deaths associated with delirium. If home detection prevented delirium as well as in-hospital programmes (30–40%) and deaths fell with it: 40–100 k a year. Association only; delirium also marks frailty, and no trial shows a home check-in saves lives.
 - 9 ACCESS (Advancing Chronic Care with Effective, Scalable Solutions): voluntary 10-year model from 1 July 2026 paying recurring outcome-aligned payments for technology-enabled chronic care; $\sim$ 150 digital health companies and providers selected. TEAM: mandatory bundled payment for five surgical episodes at $\sim$ 750 hospitals from January 2026. LEAD: 10-year ACO model from 2027, replacing ACO REACH.
